Changes

The material in this manual is for reference only and is subject to change without notice.

While reasonable efforts have been taken in the preparation of the material contained in this manual, Plasmon assumes no liability resulting from any errors or omissions, or from the use of material contained herein.

Cautions

The following images are designed to draw your attention to important information within this manual:

NOTE - Information relating to important suggestions.

CAUTION - Warnings relating to directions which could put the operator and drive at risk of damage.

TIP - Hints to achieve the optimum performance from your drive.

Release November 2002
FCC Compliance Statement

NOTE: This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to part 15 of the FCC rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by switching the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:

- Reorient or relocate the receiving antenna.
- Increase the separation between the equipment and receiver.
- Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
- Consult the dealer or an experienced radio/TV technician for help.

The compliance of this unit to the FCC rules is not subject to any special accessories, which are not readily available through normal dealer channels.

The drive is in conformity with the EMC directive and low-voltage directive.

CAUTION: Any modifications or changes made to this equipment not expressly approved by the PLASMON group of companies may void the authority to operate this equipment in its intended installation.
**Laser Product**

**Class 1 Laser Product**

The optical drive mechanism contained in this unit is certified to comply with DHHS rule 21 CFR Chapter 1, Sub-chapter J in effect as of the date for manufacture.

This optical drive mechanism is classified as a Class 1 laser product to EN 60825, and there is no hazardous laser radiation with the safety protection.

Use of controls or adjustments or performance of procedures other than those specified herein may result in hazardous radiation exposure.

Never open the enclosure or touch the parts internal to the product.

When the power switch is on, do NOT place your eyes close to the front panel opening to look into the unit.

**Laser Specification**

Class 1 LASER mechanism

Laser Power: No hazardous radiation is emitted with the safety protection of the unit.
Unpacking / Packing

(1) General precautions

Note the following precautions in order to maintain the performance and reliability of the drive.

! Open the package with particular care.
! Do not expose the unit to excessively dusty environment.
! The unit contains components that can be destroyed by static electricity.

Follow the guidelines below for internal unit:

! Use an anti-static mat and ground yourself when handling the internal unit.
! Always be sure to handle the internal unit only by the frame and do not touch any electrical components.

(2) Unpacking (Internal Unit)

When moving the unit to an environment where there is a significant difference in temperature, let the unit remain in its packaging for at least two hours.

Find a flat, soft surface for unpacking, keeping the box upright.

Do not apply excessive force to the unit when removing the shock-absorbing material, or to the surfaces and interface connector when removing the anti-static bag.

(3) Unpacking (External Unit)

When moving the unit to an environment where there is a significant difference in temperature, let the unit remain in its packaging for at least two hours.

Find a flat, soft surface for unpacking, keeping the box upright.
(4) **Packing**

Pack the unit after you have removed the disk.

Put the device in the anti-static or plastic bag.

It is desirable to use the original shock-absorbing material and packing box used when the unit was delivered to you. If not, use a box with a shock-absorbing structure that will prevent direct impacts to the device. In the case of the internal unit, protect the surfaces and interface connector against possible damage and use an anti-static bag.

(5) **Transportation**

! Transport the unit in a well-packaged condition, with the upside facing up.

! Transport the unit as little as possible after unpacking, always using the shock absorbing material to avoid impact and vibration. When carrying the unit after unpacking, keep it in the horizontal plane.

(6) **Storage**

- Use the moisture-proof packing material for storage.

- The storage environment should meet the non-operating environmental requirement as specified in Appendix E.

! Do not expose the unit to radical changes in temperature, which could cause condensation.

# Owners Record

97705153 A
The model and serial number of the drive you have just purchased are located on the underside of the unit\(^{(1)}\). Please record them below, and refer to them should you need to call your supplier for service or technical support.

**MOD520 Serial No. __________________________**

Keep this manual for reference purposes should any switch setting need to be altered.

**Warning**

Use of controls or adjustments other than those specified herein may result in hazardous laser radiation exposure. This product may only have the cover removed for service or repair by a qualified and approved service site.

\(^{(1)}\)(External) or the top of the drive (Internal).

**Air Filters**

The MOD520E (external drive) is shipped without Air Filters. The drive has been designed with ducted air cooling, air should not get into the body of the drive. Air Filters are provided for particularly dusty or dirty environments. (Please be advised that the drive will run up to a maximum ambient temperature of 30°C with air filters).
**General Description**

The MOD520 is a high performance, high capacity optical disk drive that offers recording on rewritable and CCW WORM media that is ISO compliant. The MOD520 reads and writes to 5.2GB, 4.8GB, 4.1GB, 2.6GB and 2.3GB, rewritable, WORM and DOW disks and offers read compatibility to earlier ISO standard 1.3GB, 1.2GB, 650MB and 600MB media so protecting any existing investment in storage.

The MOD520 also forms the basis for the M-Series range of Plasmon Magneto Optic jukeboxes, providing further performance increases. The MOD520 has been designed to give fast, solid and reliable disk exchanges.

Please take the time to study this manual to become familiar with operating the unit, as well as prescribed service.

The main features of the MOD520 drive are:

- 5.2GB (2.6GB per side) of storage on rewritable, and CCW WORM disks.
- Half height unit.
- Reads 594MB and 650MB disks as well as 1.2GB, 1.3GB, 2.3GB and 2.6GB media as used in earlier MO drives in addition to read & write compatibility to 2.3GB and 2.6GB disks.
- Data cache of 4MB for write and read operations.
- Effective seek time of 25ms
- Synchronous data rates up to 10 Mbytes/sec.
- Universal AC supply operates from 100 to 240 volts (MOD520E).
SCSI Connections

The external drive is equipped with two Micro D 50 way connectors on the rear panel. These are for the SCSI in and SCSI out (if there are additional devices connected).

A SCSI interface cable needs to be terminated at each end of the line, one terminator being on the last device in the chain and the other terminator is usually on the host computer or adapter card, a Micro D SCSI Terminator is supplied (external drive only).

Refer to the documentation supplied with your SCSI card or computer system should you need to check the computer termination. In normal circumstances this will usually be enabled.

The two ways of connecting SCSI devices are shown below:

Fig 1. External Drive Connection
Fig 2. Internal Drive Connection

Fig 1 External Drive Connection

1. Switch block SCSI ID setting
2. SCSI connector for additional devices or terminator if last in chain.
3. SCSI cable

If there are also internal devices on the same SCSI card, then the SCSI adapter card must have its on-board termination disabled.
Fig 2 Internal Drive Connection

1. DC Power Connector
2. Jumper block for SCSI ID settings
3. 50 way SCSI cable - note pin 1 orientation

If internal devices are also to be connected to the SCSI card, then the SCSI adapter on-board termination must be disabled. Refer to the documentation that accompanies the SCSI adapter.
SCSI Identifier

Each device on a SCSI bus requires a unique address to be set which may be in the range of 0 to 6 as address 7 is usually reserved for the host computer address. The MOD520 is shipped with a default address of 1 which will usually suffice in most cases.

Please refer to diagram on Appendix C
General Precautions for MOD520E

- Never plug or un-plug any connectors or cables from the device on the SCSI bus whilst power is applied to either host computer or any devices attached.

- Do not use the unit under the following operating environments:
  - Places with high humidity
  - Exposed to direct sunlight
  - Locations subject to excessive shock or vibration

- Do not cover ventilation slots as these are provided for cooling.

- Do not place the drive near a printer.

- Never attempt to disassemble the unit.

- Never touch the surface of a recordable disk.

- Do not allow any foreign object or liquid to enter the unit.

- Always remove the disk before moving the unit. This will ensure that the optical head is securely positioned for shipping.

- Keep the packaging material should the unit have to be transported.

Additional Notes for Internal Models

- Never connect / disconnect unit to / from SCSI bus with power on any units including host computer.

- When handling the unit, an anti-static wrist strap should be used to avoid possible damage from static electricity.

- Ensure that the power connector is correctly wired.

- Check that the power is within the unit's specification.

- Ensure that adequate ventilation is provided.
GETTING STARTED
Operation & Installation Instructions

External Drive

Do not apply power yet!

Set the SCSI ID of the unit via the DIP switch on the rear of the unit.

Connect the SCSI interface cable between the computer and the drive unit.

If the drive is the last unit on the SCSI interface, install the supplied terminator in the unused SCSI connector.

Apply power to the unit.

Insert a disk cartridge into the drive, gently pushing it into the drive until it is power loaded. The motor will start and after a few seconds the drive will be ready for use.

When the eject button is pressed the cartridge will electronically eject from the drive after a short delay.

Notes:

If you need to use the emergency eject pinhole, make sure that the unit is powered off and that the disk has stopped its rotation (20-30 seconds after power off).

If the SCSI ID is changed with the unit powered ON, then power must be removed and reapplied for the new ID to take effect.

Before moving the drive, always ensure that the optical disk cartridge is removed.

The drive has various functions that may be altered from their defaults if required. These are outlined in the MOD520I section. Opening the enclosure and changing these settings must only be carried out by a qualified service engineer.
Internal Drive

! The drive must only be used in the horizontal plane.

• Attaching screws are supplied with the unit. The screws are M3 x 4 mm, and the fixing plate should be within the range of 1.5 to 2.5 mm, which includes the washer.

• Included with internal drives is a 50-way flat IDC cable with 2 connectors for connection to the SCSI adapter.

Note for correct orientation of the flat cable when installing! Pin 1 is usually identified by a red stripe on the edge of the cable, and connectors have a small arrow by pin 1.

! Connect the internal power connector in your computer to the drive making sure that the orientation is correct.
Prechecks before Service Call

1. Disk cannot be inserted.
   - Is power on?
   - Is the disk orientated correctly?
   - Is the disk the correct type?

2. Access Failure
   - Is the cartridge inserted?
   - Is the SCSI ID set correctly?
   - Are the SCSI bus terminated correctly?
   - Is the cartridge set to write protect?
   - Are other devices on the SCSI bus operating normally?
   - Is the software device driver installed correctly?

Placing a service call

Contact your supplier or service company. They will probably require the following information;

Where purchased

Date of Purchase

Serial Number

Description of failure

System information which may include;
   - Computer type and SCSI adapter type
   - Software configuration (in DOS this will be the CONFIG.SYS and AUTOEXEC.BAT file)
   - Type of device driver being used

Software and Driver Updates

Do you have the latest revisions?

Contact your supplier for firmware or driver updates.
Service on the unit

There is no prescribed service for the unit. However, to ensure optimum performance, the unit should operate in as clean an environment as possible where contaminants do not enter the unit. Should the unit require cleaning, do NOT attempt to open the drive, but contact your supplier.

Microsoft Operating Systems and Optical support

Microsoft have confirmed that their NT operating system versions 3.51 and 4.0 do not currently FULLY support any WORM or Rewritable Optical media (512, 1024 or 2048 bytes per sector) or drives under Fat or NTFS File Systems.

NT using FAT or NTFS, only supports Optical if the drive and media act as a Magnetic Hard Drive. (Type 0 Device)

Windows NT will support both WORM and Rewritable Optical media when used with another File System (such as Plasmon Drive Manager for NT).

FAT and NTFS with full Optical support are being looked into for a future release of NT from Microsoft.

Microsoft have committed that Windows 95 will read and write Rewritable Optical media only when it has been formatted with third party software. WORM media is not supported and requires third party software.

Customers using NT with Plasmon Multitasking Manager have no need for any action.

For details of Optical support in future products from Microsoft, please contact them direct.

OSTA
June 1997
Disk Cartridge Notes

1. Never open the shutter to look at the disk. The shutter is provided for protection against dust, dirt and other contaminants.

2. Avoid subjecting the cartridge to sudden shock or impact.

3. When the write protect window is open, the disk is in a read only mode of operating.

Option Switch Function

NOTE: The MOD520I is shipped with the forced verify on write operation enabled.

NOTE: The drive is shipped with write caching enabled by default. In data critical applications it may be necessary to disable write caching. This may be achieved using Adaptec’s “SCSI EXPLORER” program under the windows environment. Programmers may also access this function through the Mode Page Settings.
